

# Coupling ORCHIDEE to DYNAMICO

L. Fita

Laboratoire de Météorologie Dynamique (LMD), CNRS, UPMC, Jussieu, Paris, France

November 8, 2016

## Abstract

This note documents the work done to prepare the coupling of ORCHIDEE land model to DYNAMICO atmospheric dynamics. In order to make the coupling a re-organization was necessary to be done in the section of the code responsible of the interpolation of the morphology data (PFT, albedo, LAI, ...) from different files done by L. Fita in the mark of the HEAT project. This work is necessary in order to prepare ORCHIDEE to use XIOS libraries to interpolate the same data. This document describes all the steps done as a way to provide more insights and aims to left a testimony of the work done for that people how might face similar tasks.

## 1 Introduction

HEATproject aims to develop a new Global Climate Model (GCM) using different components of the current Global Climate Model from the Institute Pierre et Simon Laplace (IPSL, <http://www.ipsl.fr/>):

- New atmospheric dynamical core called DYNAMICO (<http://forge.ipsl.jussieu.fr/dynamico>) leaded by T. Dubos (LMD)
- LMD atmospheric physics from: Laboratoire de Météorologie Dynamique (LMDZ, (<http://lmdz.lmd.jussieu.fr/>)
- IPSL land model: Organising Carbon and Hydrology In Dynamic Ecosystems (ORCHIDEE, (<http://labex.ipsl.fr/orchidee/>)
- ocean model: Nucleus for European Modelling of the Ocean (NEMO, <http://www.nemo-ocean.eu/> in collaboration with other institutions)
- IPSL atmospheric chemistry: INteraction avec la Chimie et les Aérosols (INCA, <http://www.lsceinca.cea.fr/>)
- ...

DYNAMICO uses an unstructured grid and XIOS libraries for I/O (<http://forge.ipsl.jussieu.fr/ioserver/>). All the components have to be prepared to be able to work on an unstructured grid (or not with OASIS model coupler) and with XIOS libraries. Thus, code components' have to use XIOS and ORCHIDEE's input and initialization files have to be understandable by XIOS

Due to efficiency constrains ORCHIDEE will be directly coupled to DYNAMICO. Current trunk version of ORCHIDEE uses XIOS for the output. Thus, ORCHIDEE should be prepared to use XIOS also for the input data. Planned steps:

1. Prepare ORCHIDEE to use XIOS variables-like outcome:  
Do not add any new feature. JUST re-organization & standardization of the existing code
2. Prepare ORCHIDEE forcing files for XIOS

Work done in a new branch:

<svn://forge.ipsl.jussieu.fr/orchidee/branches/ORCHIDEE-DYNAMICO/ORCHIDEE>

More information at:

<https://forge.ipsl.jussieu.fr/orchidee/wiki/DevelopmentActivities/ORCHIDEE-DYNAMICO>

All this work is done via the creation of a new Fortran module called `interpweight`. Its main objectives are:

1. Prepare ORCHIDEE's interpolation code for XIOS
2. Generalize and flexibilize interpolation
3. Without introducing any new piece of code, just re-organize it

Current interpolation presents a series of characteristics:

- Uses a set of Fortran subroutines with an interface called `aggregate_p`. It searches the grid points from the source file which lies within the area of a grid point towards one wants to interpolate.
- Has a specific/particular interpolation for each file
- Different ranks 2D, 3D, 4D and kind of variables: unique value per grid point (`carteveg5km.nc`), multiple fractions per grid point (`PFTmap.nc`), continuous fields (`reftemp.nc`)
- Perform mainly three steps (file depending):

1. Modification of values from file
2. Creation of land/sea mask using values from file
3. Interpolate values

General aim of `interpweight` consist on:

- Join different ‘methods’ of each step in all purpose routines
- Get some key information (range of values, dimensions, ...) directly from data
- Prepare ORCHIDEE’s subroutines to use same output as the one provided by XIOS
- Completely disappear once XIOS is introduced

For that reason a series of new generic subroutines have been created (an kept all together within `src_global/interpweight.F90` which generalize the current interpolation steps:

1. Modification of initial values: *Removing that wrong values from the file*  
`interpweight_modifying_input[1/2/3/4]D`: subroutines to modify 1D, 2D, 3D or 4D input data from file, using different methods: `noneg`
2. Masking input: *Compute ‘on fly’ the values of the land/sea mask taking the values in the file*  
`interpweight_masking_input[1/2/3/4]D`: subroutines to compute the mask using data from input file using different methods: `nomask`, `mbelow`, `mabove`, `msumrange`, `var`
3. Area weights: Get coincident areas from input file to the target projection using `aggregate_p`  
No changes on it
4. Interpolate: Use obtained areas and interpolate values at each grid point at the same format as it will be provided by XIOS
  - `interpweight_provide_fractions[1/2/3/4]D`: Perform interpolation for fraction/category data
  - `interpweight_provide_interpolation[2/4]D`: Perform interpolation for continuous data
  - `variableusetypes`: Variable to provide the values along the additional dimension to perform the interpolation. (e.g.: in case the 13 pfts are: 1,3,6,18,23,34,35,39,48,...)
5. A new variable is added which explains the ‘availability’ of data to perform the interpolation (0, 1). When it is negative it means that there was no data for that grid point (see example in appendix 2)

$$availability = \frac{\sum_{i=1}^{Npts} A_i^{source}}{Area\ target\ grid\ point} \quad (1)$$

## 2 Planned work

1. XIOS2 & `interpWeight`
  - Release of XIOS2
  - Grouping of current interpolation (read, `aggregate_p`, apply weights and bring back fractions) in ORCHIDEE into a new module (`interpWeight`)
2. Commit and test both steps on the trunk
3. Open a new branch for the interpolation with XIOS2 [January 2016]

4. Work on the interpolation (doing nothing for the calendar) with a new `module_InterpWeight_XIOS` but with XIOS2
5. Validation off-line
6. Implement it on the current version on the trunk
7. Coupling to DYNAMICO

This document only describes until the commit to the trunk.

### 3 ORCHIDEE

This work takes the branch version<sup>1</sup>, creation of a new `ORCHIDEE_DYNAMICO` model version, see appendix D):

```
$ svn co --username lluis.fita
$ svn co http://forge.ipsl.jussieu.fr/igcmg/svn/modips1/trunk modips1
$ cd modips1/util
$ ./model ORCHIDEE_DYNAMICO
```

#### 3.1 Current Interpolation

Interpolation in ORCHIDEE is currently (revision #2627, 26/iii/2015) spread in the code done by each file as follows:

1. Open data file (mainly regular lon/lat files)
2. Modify input values (following specific rules for each file)
3. Mask input values (following specific rules for each file)
4. Call subroutine `aggregate_p` which computes the interpolation weights
5. Get the new interpolation values by application of the interpolation weights

Actually the subroutine `aggregate_p` is found in a series of subroutines which deals individually with each file:

- `src_global/interpol_help.f90`: Aggregation routines, in an INTERFACE statement which is an interface to the subroutines `aggregate_2d_p`, `aggregate_vec_p`
- `src_sechiba/condveg.f90`: Initialise, compute and update the surface parameters emissivity, roughness and albedo, in subroutine: `condveg_soilalb` (for file '`soils_param.nc`'), `condveg_background_soilalb` MODIS retrieved albedo (for file '`alb_bg_jrctip.nc`')
- `src_sechiba/routing.f90`: Routes the water over the continents into the oceans and computes the water stored in floodplains or taken for irrigation, in subroutine: `routing_irrigmap` (for file '`floodplains.nc`')
- `src_sechiba/slowproc.f90`: Initializes/updates vegetation cover, vegetation properties (LAI and fractional cover), in subroutines: `slowproc_interlai` (for file '`lai2D.nc`'), `slowproc_update` (for file '`PFTmap.nc`'), `slowproc_interp` (for file '`carteveg5km.nc`'), `slowproc_soilt` (for file '`soils_param.nc`') and `slowproc_slope` (for file '`cartepente2d_15min.nc`')
- `src_sechiba/chemistry.f90`: in `chemistry_initialize` using of a vegetable fertilization (for file '`orchidee_fertilizer_1995.nc`' and '`orchidee_bbg_clim.nc`')

There is a complementary interpolation in the STOMATE in `thermsoil.f90` and `thermsoilc.f90` (via the subroutine `read_reftempfile` for the file '`reftemp.nc`'), which is currently not managed throughout `aggregate_p`.

---

<sup>1</sup>following the instructions on <http://forge.ipsl.jussieu.fr/igcmg/wiki/platform/documentation/installation>

### 3.2 InterpWeight

This subroutine should account for all the interpolation which it is currently in the ORCHIDEE model<sup>2</sup>. It generalizes the interpolation by the introduction of a generic subroutine (see table 1 for the methods per variable) from which one obtains the fractions of a series of types in each grid point. It will provide two variables:

- **ovar**: fractions of all the input categories into the interpolated projection:
- **aovar**: Availability of input data for the interpolation
  - [0., 1.]: Ratio between the taken input surface to interpolate and the surface of a given grid point
  - -1: Any equivalent input grid point has been found

The workflow of the main subroutines of interpolation modified from the original versions found in `condveg.f09` and `slowproc.f90` is left as follows<sup>3</sup>:

1. Selection of the file
2. Set-up required variables
3. Use of new subroutine `interpweight_1D`, `interpweight2D`, `interpweight3D` or `interpweight4D`: Provides the fraction on all the grid points of the final fraction of each of the types after the interpolation (1D to 4D input data version, see appendix A). They use:
  - (a) open file
  - (b) read variable
  - (c) apply corrections to the variable: apply a filter in order to get rid of weird values: zero
  - (d) set-up the mask: Create the mask according to: `nomask`, `maskvarname`, `maskabove`, `maskbelow`, `masksumrange`
  - (e) use `aggregate_p`: provides the areas and indices for each grid point to be used in the interpolation.
  - (f) use `provide_fractions2D_in2D`, `provide_fractions3D_in3D` or `provide_fractions4D_in4D`: provides the fractions at each grid point of all the types. If no values to interpolate are find for a given grid point the average of the minimum and maximum possible values is used (`varmin`, `varmax`, on the subroutine call)
4. With the variable that contains the fractions for each type of kind, the interpolation can be done following the specificities of each file/variable
5. For that kind of grid points with known issues (i.e. no values), automatic corrections are applied. At these problematic grid points, a given value on the quality variable `aovar` is assigned (see table 2)

#### 3.2.1 CF standardization of input files

In order to simplify the interpolation within the ORCHIDEE, a series of standards to accomplish for the input files are proposed to be followed. More details can be found in the ORCHIDEE wiki page at <https://forge.ipsl.jussieu.fr/orchidee/wiki/Documentation/Forcings/CfStandard>.

All the input data will be slightly modified:

- All the oceanic values will passed to a netCDF `FillValue` value.
- A new variable will be added to the files in order to provide information about the meaning of the different types included in the file (see details in appendix B). This new variable called `[var]names` will be a string variable with a content like:

---

<sup>2</sup>NOTE: before revision r3688, module was called `module_InterpWeight`. Afterwards ORCHIDEE's coding rules ([https://forge.ipsl.jussieu.fr/orchidee/attachment/wiki/Documentation/ORCHIDEE\\_Coding\\_Guidelines\\_v1.0.pdf](https://forge.ipsl.jussieu.fr/orchidee/attachment/wiki/Documentation/ORCHIDEE_Coding_Guidelines_v1.0.pdf)) were applied, see more details in appendix A

<sup>3</sup>a different interpolation is found for the modules `routing.f90`, `chemistry.f90` and `thermsoil.f90`, `thermsoilc.f90`

Table 1: Table of the ‘methods’ used by each variable. ‘corr.’, stands for corrections. ‘ma’, stands for maskabove, ‘mb’, stands for maskbelow and ‘msr’, stands for masksumrange. ‘msech’ stands for min\_sechiba=1.e-8, mavar stands for maskvarname, ‘noma’ stands for nomask

Table 2: Assigned availability values for that grid points with interpolation problems

Value	Meaning
0. $\leq$ 1.	Fraction of input data used to cover the interpolated grid point ( $\equiv 1.$ , fully covered)
$\leq$ 0.	Not data available for the interpolation some ‘on-air’ corrections have been made <ul style="list-style-type: none"> <li>-1. No data available from input file src_sechiba/slowproc.f90#slowproc_readvegetmax: PFTmap.nc</li> <li>-0.25 No conservation of sum of veget_next. The sum of veget_next is different after reading Land Use map (verify the dgvm case model)</li> <li>-0.5 Problem with vegetation file for Land Use. No land point in the map for point (verify your land use file) src_sechiba/slowproc.f90#slowproc_interp: carteveg5km.nc</li> <li>-1.2 Antarctica, Artica, Greenland points (impose vegetation_map = 0 )</li> </ul>

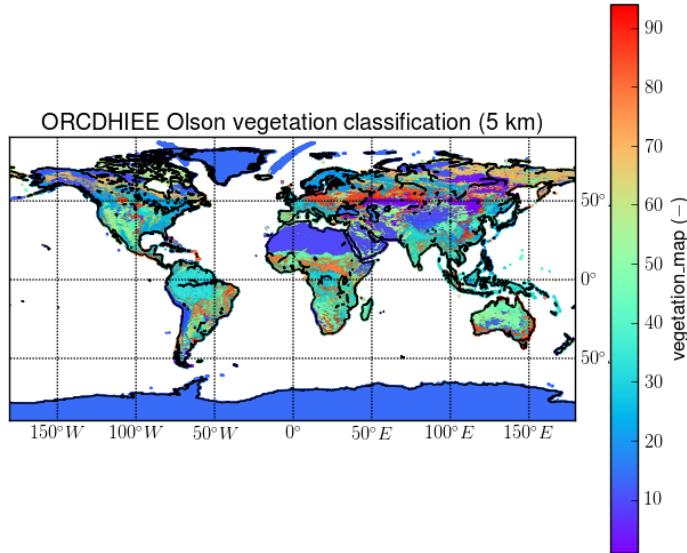

Figure 1: Olson vegetation classification included in `carteveg5km_XIOS.nc` at 5km resolution in a Goode projection

```
char [var]names(N[var], Lstring) ;
[var]names:standard_name = "[var]names" ;
[var]names:long_name = "description of [var] types" ;
[var]names:units = "-" ;
```

With values like:

```
[var]names =
"1: [type 1]",
"2: [type 2]",
(...),
"N: [type N]" ;
```

At the same time, some recommendations of simplification of the code are recommended:

- removal of `neighbours` and `conffrac` from the `aggregate_p`
- removal of all the masking and input modification taking advantage of the CF-standardized files

### Olson classification

The Olson vegetation classification comes from the file `carteveg5km.nc`. It contains a compressed format of the information, only the continental land points are saved. The file contains only triplets of longitude, latitude and vegetation type (from 94 possible values, see table 7). It is in a space conservative projection called Goode<sup>4</sup>. The file was created by Nicolas Viovy at LSCE, using c-libraries from Dan Steinwand's code available from (<http://edc2.usgs.gov/1KM/zip/gihll2ls.c>)

In order to transform to a CF-like format, it has been decompressed. That means that a full 2D global map has been created with the same data and using the same libraries to obtain the pairs of longitudes and latitudes of the whole planet. At the same time, the cell boundaries have also been attached to the resultant final file called `carteveg5km_XIOS.nc` (see figure 1, with the resultant map).

### 3.2.2 routing

Routing has to be treated separately since the interpolation of the required files (from '`routing.nc`') is much more complex. At this stage (April 29th 2016) this is not treated.

<sup>4</sup>[https://en.wikipedia.org/wiki/Goode\\_homolosine\\_projection](https://en.wikipedia.org/wiki/Goode_homolosine_projection)

### 3.3 Merging with trunk

On May 26th 2016, in order to facilitate the merging with the ‘trunk’, a merging between the branch and the trunk is scheduled. The merging will start from the last merging between the branch and the trunk (which was done in with version 3190, see [D.1.1](#)). A second merge was done on June 8th 2016 (r3531). The merging will be as (in folder `/data/lfita/DATA/`)

```
$ svn merge -r 3910:[current version of trunk] svn://forge.ipsl.jussieu.fr/orchidee/trunk
```

See more details in appendix [E](#)

### 3.4 InterpWeight\_XIOS

## 4 DYNAMICO & ORCHIDEE

DYNAMICO uses an unstructured grid. Because of that, ORCHIDEE has to be generalized, since for example, unstructured has a variable number of neighbors. This generalization is done in parallel by J. Polcher, which generalizes the use of ORCHIDEE via its coupling to the WRF model. To be done and describe in an other document

## A From module\_InterpWeight to interpweight

A large amount of changes have been introduced from the original `module_interpweight.f90` in order to get working with `interpweight.f90`. With J. Ghantas on August 2016 (commit # 3694), some improvements, code cleaning and optimizations have been introduced.

- All subroutines/functions in `interpweight` names start with `interpweight`
- All subroutines/functions in `interpweight` are PRIVATE, except that ones used by ORCHIDEE (via a PUBLIC statement)
- All subroutines/functions in `interpweight` provided with a header and description of variable in same definition line after !!
- Remove all the OPTIONAL variables from `interpweight`.
  - if `initime` is -1, it is not used
  - `nonegative` is a mandatory value when modifying input values
  - Introduce new variables in `interpweight` when masking variables: `masktype`, `maskvalues` and `maskvar`
  - `provide_fractions/interpolate`, now only accept one variable with the desired shape for each function: 1D, 2D, 3D, 4D
- Enforce use of standard values in `interpweight` for number of types: ‘classnb’, ‘nvm’, ‘nolson’, ‘nzobler’, ‘nsclm’, ....
- Introduce availability data for interpolation in the XML outputs (see appendix G as an example to add a variable in XIOS): `achem_wrice`, `achem_other`, `achem_co2`, `asoilcol`, `aalb_bg`, `alaimap`, `aveget`, `aveget5k`, `atext`, `aslope`, `reftemp`, `reftempc`
- Clarify meaning of new variables in the code
- Check all allocations
- Remove the use of `typevardims` (this would be re-introduced later when XIOS2 will be used)
- use of Fortran variable construction (`/ (i, i=1,Ntypes) /`) instead of function `interpweight_RangeI`
- move ‘nearest’ outside `nbpt` loop for `cartevegeget5km.nc` with a IF (`ANY(aveget<zero)`)
- check use of `soils_param_usda.nc` by `slowproc_soilt` (not checked before). Also the ‘none’ case. Following documentation from A. Ducharme [http://forge.ipsl.jussieu.fr/orchidee/attachment/wiki/Documentation/UserGuide/eqs\\_hydro.pdf](http://forge.ipsl.jussieu.fr/orchidee/attachment/wiki/Documentation/UserGuide/eqs_hydro.pdf). Introduction of the new variable `ntextfile`

Table 3: Table of soil colors and their correspondence with their albedo (from `src_parameters/constantes.f90`)

#	value	dry		wet	
		visible	infrared	visible	infrared
1	light (brightness=1)	0.24	0.48	0.12	0.24
2	bright (brightness=0.875)	0.22	0.44	0.11	0.22
3	sunny (brightness=0.750)	0.20	0.40	0.10	0.20
4	vivacious (brightness=0.625)	0.18	0.36	0.09	0.18
5	claire (brightness=0.500)	0.16	0.32	0.08	0.16
6	dull (brightness=0.375)	0.14	0.28	0.07	0.14
7	shadowy (brightness=0.250)	0.12	0.24	0.06	0.12
8	dusk (brightness=0.125)	0.10	0.20	0.05	0.10
9	dark (brightness=0)	0.27	0.55	0.15	0.31

Table 4: USDA soil textures and their constitution

#	value	sand [%]	clay [%]
1	Sand	0.93	0.03
2	Loamy Sand	0.81	0.06
3	Sandy Loam	0.63	0.11
4	Silt Loam	0.17	0.19
5	Silt	0.06	0.10
6	Loam	0.40	0.20
7	Sandy Clay Loam	0.54	0.27
8	Silty Clay Loam	0.08	0.33
9	Clay Loam	0.30	0.33
10	Sandy Clay	0.48	0.41
11	Silty Clay	0.06	0.46
12	Clay	0.15	0.55

## B Types values

Description of the different values found in each table

### B.1 Colors

The values of the descriptions for the soil colors (?) are extracted from `condveg.f90` subroutine `get_soilcorr_zobler`. Values for the file `soils_param.nc`. See the correspondence among soil color number and albedos in table 3

### B.2 Textures

The values of the descriptions for the USDA soil textures (?) are extracted from `slowproc.f90` subroutine `get_soilcorr_usda`. Values (see table 4) for the file `soils_param_usda.nc`

The values of the descriptions for the Zobler soil textures (?) are extracted from `slowproc.f90` subroutine `get_soilcorr_zobler`. Values (see table 5) for the file `soils_param.nc`

### B.3 Vegetation

The values of the descriptions from a simplified classification of 13 PFTs which are provided in table 6, contained in the file `PFTmap.nc`

The values of the descriptions for the Olson vegetation types (??) are extracted from `slowproc.f90` subroutine `get_vegcorr` (see table 7). Values for the file `carteveg5km.nc`

Table 5: Zobler soil textures. On <http://geonetwork.grid.unep.ch/geonetwork/srv/en/metadata.show?uuid=fb650de3-28d4-4461-92bd-36f5182b0de3> there are eight classes (organic) and their constitution

#	value	silt [%]	sand [%]	clay [%]
1	Coarse	0.12	0.82	0.06
2	Medium	0.32	0.58	0.10
3	Fine	0.39	0.43	0.18
4	Coarse-Medium	0.15	0.58	0.27
5	Coarse-Fine	0.34	0.32	0.34
6	Medium-Fine	0.00	1.00	0.00
7	Coarse-Medium-Fine	0.39	0.43	0.18

93	cold deciduous tree crop	94	wet sclerophyllic forest

## C interpweight

The current interpolation of the required data to run ORCHIDEE has been modified to a new methodology in which, new generic subroutines have been designed. All the new required subroutines and functions are contained in module `src_global/module_InterpWeight.f90` (see table 9). The final idea is to prepare the code in order to make easy the transformation from the current Input/Output use of the IOIPSL (<http://lmdz.lmd.jussieu.fr/utilisateurs/faq-en/installation/comment-installer-icips1-et-loutil-rebuild>) libraries to the new ones XIOS. This subroutine called `InterpWeight[N]D`, has three different versions as function of the input data to interpolate (1, 2, 3 and 4-D data).

The three versions have a similar call (taken the 3D version as reference<sup>5</sup>):

```
interpweight_3D(nbpt, Nvariabletypes, variabletypes, lalo, resolution,
neighbours, contrfrac, filename, varname, inlonname, inlatname, varmin,
varmax, noneg, masktype, maskvalues, maskvarname, dim1, dim2, initime,
typefrac, plevel, nout, maxresollon, maxresollat, outvar3D, aoutvar)
```

Characteristic of the variables passed to the subroutine are provided in table 8.

---

<sup>5</sup>**NOTE:** Not all the subroutines have all the masking options

Table 8: Information of the variables used on the `InterpWeight [N]D` subroutines

<b>name</b>	<b>type</b>	<b>dimension</b>	<b>intent</b>	<b>description</b>
<code>nbpt</code>	INTEGER <sup>a</sup>	-	in	Number of points for which the data needs to be interpolated
<code>Nvariabletypes<sup>b</sup></code>	INTEGER	-	in	Number of types of the variable
<code>variabletypes</code>	REAL <sup>c</sup>	(Nvariabletypes)	in	Vector of values of the types
<code>lalo</code>	REAL	(nbpt,2)	in	Vector of latitude and longitudes (beware of the order = 1 : latitude, 2 : longitude)
<code>resolution</code>	REAL	(nbpt,2)	in	The size in km of each grid-box in X and Y
<code>neighbours</code>	INTEGER	(nbpt,8)	in	Vector of neighbours for each grid point (1=N, 2=NE, 3=E, 4=SE, 5=S, 6=SW, 7=W, 8=NW)
<code>contfrac</code>	REAL	(nbpt)	in	Fraction of land in each grid box
<code>filename</code>	CHAR <sup>80d</sup>	-	in	name of the input map to read
<code>varname</code>	CHAR <sup>80</sup>	-	in	name of the variable to interpolate
<code>inlonname</code>	CHAR <sup>80</sup>	-	in	names of the longitude in the input file
<code>inlatname</code>	CHAR <sup>80</sup>	-	in	names of the latitude in the input file
<code>varmin</code>	REAL	(d1)	inout	min values to use for the renormalization <sup>e</sup>
<code>varmax</code>	REAL	(d1)	inout	max values to use for the renormalization
<code>noneg</code>	LOGICAL	-	in	mask negative values
<code>masktype</code>	CHAR <sup>50f</sup>	-	in	Type of masking 'nomask': no-mask is applied 'mbelow': take values below mvalues(1) <sup>g</sup> 'mabove': take values above mvalues(1) 'msumrange': take values within 2 ranges; mvalues(2)<=SUM(vals(k))<=mvalues(1) mvalues(1)< SUM(vals(k))<=mvalues(3) (normalize by mvalues(3)) 'var': mask values are taken from a variable (>0.)
<code>maskvalues</code>	REAL	(3)	in	values to use to mask (according to ' <code>masktype</code> )
<code>maskvarname</code>	CHAR <sup>250h</sup>	-	in	name of the variable inside the file with the mask
<code>typefrac</code>	CHAR <sup>50</sup>	-	in	Type of fraction retrieval: 'XYKindTime': Input values are kinds of something with a temporal evolution on the dx*dy matrix'
<code>dim1</code>	INTEGER*	-	in	3D dimension of the output variable <sup>i</sup>
<code>dim2</code>	INTEGER*	-	in	4D dimension of the output variable <sup>j</sup>
<code>intime</code>	INTEGER*	-	in	Initial time to take (for input data with time values)
<code>plevel</code>	INTEGER*	-	in	Level of print (for debugging, 0 to 5)
<code>nout</code>	INTEGER*	-	in	Standard output unit
<code>outvar3D</code>	REAL	(nbpt,d1)	out	3D output variable and re-dimensioned
<code>aoutvar</code>	REAL	(nbpt)	out	Availability of input data for the interpolation
<code>sumfrac</code>	REAL	(nbpt)	out	TOTAL sum of spatial fractions used in the grid point

<sup>a</sup>integer kind i\_std=4<sup>b</sup>shortcut Nvartyp<sup>c</sup>real kind r\_std=4<sup>d</sup>equivalent to CHARACTER (LEN=80)<sup>e</sup>in interpweight\_2D this value and varmax are scalars<sup>f</sup>equivalent to CHARACTER (LEN=50)<sup>g</sup>shortcut of maskvalues(1)<sup>h</sup>equivalent to CHARACTER (LEN=250)<sup>i</sup>usually Nvartyp<sup>j</sup>usually time

Table 9: Subroutines and functions of the new module `src_global/module_InterpWeight.f90`. S: subroutine, F: function

<b>name</b>	<b>type</b>	<b>description</b>
<code>interpweight_1D</code>	S	Interpolate any input file to the grid of the model for a 1D-variable
<code>interpweight_2D</code>	S	Interpolate any input file to the grid of the model for a 2D-variable
<code>interpweight_3D</code>	S	Interpolate any input file to the grid of the model for a 3D-variable
<code>interpweight_4D</code>	S	Interpolate any input file to the grid of the model for a 4D-variable
<code>interpweight_2Dcont</code>	S	Interpolate any input file to the grid of the model for a continuous 2D-variable
<code>interpweight_4Dcont</code>	S	Interpolate any input file to the grid of the model for a continuous 4D-variable
<code>interpweight_calc_resolution_in</code>	S	Compute the resolution of the input data
<code>interpweight_modifying_input1D</code>	S	Modify the initial 1D values from the given file
<code>interpweight_modifying_input2D</code>	S	Modify the initial 2D values from the given file
<code>interpweight_modifying_input3D</code>	S	Modify the initial 3D values from the given file
<code>interpweight_modifying_input4D</code>	S	Modify the initial 4D values from the given file
<code>interpweight_masking_input1D</code>	S	Mask input 1D values
<code>interpweight_masking_input2D</code>	S	Mask input 2D values
<code>interpweight_masking_input3D</code>	S	Mask input 3D values
<code>interpweight_masking_input4D</code>	S	Mask input 4D values
<code>interpweight_provide_fractions1D</code>	S	Provide 1D fractions from a 1D incoming variable
<code>interpweight_provide_fractions2D</code>	S	Provide 2D fractions from a 2D incoming variable
<code>interpweight_provide_fractions3D</code>	S	Provide 3D fractions from a 3D incoming variable
<code>interpweight_provide_fractions4D</code>	S	Provide 4D fractions from a 4D incoming variable
<code>interpweight_provide_interpolation2D</code>	S	Provide 2D interpolation from a continuous 2D incoming variable
<code>interpweight_provide_interpolation4D</code>	S	Provide 4D interpolation from a continuous 4D incoming variable
<code>interpweight_handle_err</code>	S	Provide the error message when something with netCDF went wrong <sup>a</sup>
<code>interpweight_get_var2dims_file</code>	F	Get the dimensions of a given 2D variable inside a file
<code>interpweight_get_var3dims_file</code>	F	Get the dimensions of a given 3D variable inside a file
<code>interpweight_get_var4dims_file</code>	F	Get the dimensions of a given 4D variable inside a file
<code>interpweight_get_varNdims_file</code>	F	Get the number of dimensions of a given variable inside a file
<code>interpweight_Index1DArrayI</code>	F	Provide the first index of a given value inside a 1D integer array
<code>interpweight_Index1DArrayR</code>	F	Provide the first index of a given value inside a 1D real array
<code>interpweight_Index2DArrayI</code>	F	Provide the first index of a given value inside a 2D integer array
<code>interpweight_Index2DArrayR</code>	F	Provide the first index of a given value inside a 2D real array
<code>interpweight_Index1DLonLat</code>	F	Provide the first index of a given pair of longitude and latitude from a set of lon, lat 1D arrays
<code>interpweight_Index2DLonLat</code>	F	Provide the first index of a given pair of longitude and latitude from a set of lon, lat 2D arrays
<code>interpweight_RangeI</code>	F	Provide a range of d1 values from 'iniv' to 'endv', of integer values in a vector
<code>interpweight_RangeR</code>	F	Provide a range of d1 values from 'iniv' to 'endv', of real values in a vector
<code>interpweight_ValVecI</code>	F	Provide the number of times and where that a given value 'oper' on a vector of integers
<code>interpweight_ValVecR</code>	F	Provide the number of times and where that a given value 'oper' on a vector of reals

## D DYNAMICO-ORCHIDEE in CICLAD

### D.1 Compilation

This are the different steps followed for the compilation of the coupling ORCHIDEE-DYNAMICO in `ciclad`

1. Settin up ORCHIDEE subversion user in ciclad:

```
$ svn co --username lluis.fita
```

2. Checking out the code:

```
$ svn co http://forge.ipsl.jussieu.fr/igcmg/svn/modipsl/trunk modipsl
```

3. Setting up new model related to the coupling DYNAMICO-ORCHIDEE:

```
$ cd modipsl/util
vim mod.def
```

```
#-H- ORCHIDEE_DYNAMICO ORCHIDEE-DYNAMICO configuration
#-H- ORCHIDEE_DYNAMICO This is a working configuration using the latest revision of ORCHIDEE trunk
#-M- ORCHIDEE_DYNAMICO Josefine.Ghattas@ipsl.jussieu.fr
#-C- ORCHIDEE_DYNAMICO IOIPSL/tags/v2_2_2/src HEAD 8 IOIPSL/src modeles
#-C- ORCHIDEE_DYNAMICO branches/ORCHIDEE-DYNAMICO/ORCHIDEE HEAD 14 ORCHIDEE modeles
#-C- ORCHIDEE_DYNAMICO trunk/ORCHIDEE_OL HEAD 14 ORCHIDEE_OL config
#-C- ORCHIDEE_DYNAMICO XIOS/branchs/xios-1.0 604 12 XIOS modeles
```

4. Getting the code<sup>6</sup>

```
$ ./model ORCHIDEE_DYNAMICO
```

5. Compiling the code<sup>7</sup>:

```
$ ./ins_make >& run_ins_make.log
```

6. **debugging NOTE:** Changes in AA\_make.gdef<sup>8</sup>

```
#-Q- ifort_CICLAD #F_O = -DCPP_PARA -O3 $(F_D) $(F_P) -I$(MODDIR)
-module $(MODDIR) -fp-model precise
#-Q- ifort_CICLAD F_O = -DCPP_PARA -p -g -traceback -fp-stack-check
-ftrapuv -check bounds $(F_D) $(F_P) -I$(MODDIR) -module $(MODDIR)
```

7. Going there:

```
$ cd ../config/ORCHIDEE_OL
```

8. Modifying some issues for compilation in CICLAD (in `Makefile`, adding no-parallel compilation):

```
(...) ./make_xios --netcdf_lib netcdf4_seq (...)
```

---

<sup>6</sup>**NOTE:** use the right pwd for the subversion user!!

<sup>7</sup>following <http://forge.ipsl.jussieu.fr/igcmg/wiki/IPSLCM5A#Commentacc%c3%a9der%c3%a0IPSLCM5Acompileretlancerunepremi%c3%a8reexp%c3%a9rience>

<sup>8</sup>after <http://forge.ipsl.jussieu.fr/orchidee/wiki/Documentation/UserGuide/flags>

## 9. Compiling

```
$ gmake >& run_gmake.log
```

## 10. Checking for errors (should be empty):

```
$ cat -n run_gmake.log | grep Error
$ cat -n run_gmake.log | grep Erreur
```

## 11. A version problem occurred during the process. See appendix D.1.1 for more information

### D.1.1 Subversion problem

During the implementation of the changes, initial working copy of `src_sechiba/condveg.f90` and `src/sechiba/slowproc.f90` where not the same as the versions in the branch. Thus, a compilation problem arises:

In order to fix it, branch is updated with the last version of the trunk, on Thu Feb 4 11:42:42 CET 2016:

## 1. Gathering trunk version when the branch was created (on the branch working copy):

```
$ svn log | more
(...)
-----
r3141 | lluis.fita | 2016-01-21 17:50:16 +0100 (Thu, 21 Jan 2016) | 2
lines

Adding first version of the new interpolation

-----
r3129 | josefine.ghattas | 2016-01-18 15:25:52 +0100 (Mon, 18 Jan 2016)
| 3 lines

Copied revision 3115 on the trunk into new branch ORCHIDEE-DYNAMICO.
(...)
```

## 2. Getting actual version of the branch:

```
$ svn up
U     arch/arch-X64_ADA.fcm
U     arch/arch-X64_ADA.path
Updated to revision 3190.
```

## 3. Getting branch information:

```
$ svn info
Path: .
URL: svn://forge.ipsl.jussieu.fr/orchidee/branches/ORCHIDEE-DYNAMICO/ORCHIDEE
Repository Root: svn://forge.ipsl.jussieu.fr/orchidee
Repository UUID: f489ceea-5127-0410-b15c-c4a6149ed9a7
Revision: 3190
Node Kind: directory
Schedule: normal
Last Changed Author: yann.meurdesoif
Last Changed Rev: 3190
Last Changed Date: 2016-02-04 06:51:47 +0100 (Thu, 04 Feb 2016)
```

## 4. Merging with trunk version:

```
$ svn merge -r 3129:3190 svn://forge.ipsl.jussieu.fr/orchidee/trunk/ORCHIDEE
--- Merging r3130 through r3190 into '.':
--- Merging r3130 through r3190 into '.':
U   src_parallel/xios_orchidee.f90
U   src_parallel/ioipsl_para.f90
U   orchidee.default
U   src_sechiba/condveg.f90
Conflict discovered in 'src_sechiba/slowproc.f90'.
Select:  (p) postpone, (df) diff-full, (e) edit,
(mc) mine-conflict, (tc) theirs-conflict,
(s) show all options: p
C   src_sechiba/slowproc.f90
U   src_parameters/constantes.f90
U   src_parameters/constantes_mtc.f90
U   src_parameters/constantes_var.f90
Summary of conflicts:
Text conflicts: 1
```

## 5. Getting actual status:

```
$ svn st
?       .config
(...)
M   src_parallel/xios_orchidee.f90
M   src_parallel/ioipsl_para.f90
M   orchidee.default
?   src_sechiba/slowproc.f90.working
?   src_sechiba/slowproc.f90.merge-right.r3190
?   src_sechiba/slowproc.f90.merge-left.r3129
M   src_sechiba/condveg.f90
C   src_sechiba/slowproc.f90
M   src_parameters/constantes_mtc.f90
M   src_parameters/constantes_var.f90
M   src_parameters/constantes.f90
```

The conflict arises as:

```

<<<<< .working

!! =====
!! SUBROUTINE : slowproc_change_frac
!!
!! >BRIEF      Update the vegetation fractions
!!
!! DESCRIPTION : Update the vegetation fractions. This subroutine is called in the same time step as lcchange in stomatelpj has
!!                been done. This subroutine is called after the diagnostics have been written in sechiba_main.
!!
!! RECENT CHANGE(S): None
!!
!! MAIN OUTPUT VARIABLE(S): :: veget_max, veget, frac_nobio, totfrac_nobio, tot_bare_soil, soiltile
!!
!! REFERENCE(S) : None
!!
!! FLOWCHART   : None
!! \n
-- =====

SUBROUTINE slowproc_change_frac(kjpindex, lai, &
                                 veget_max, veget, frac_nobio, totfrac_nobio, tot_bare_soil, soiltile)
!
! 0. Declarations
!
! 0.1 Input variables
INTEGER(i_std), INTENT(in)      :: kjpindex      !! Domain size - terrestrial pixels only
REAL(r_std), DIMENSION (kjpindex,nvm), INTENT(in) :: lai          !! Leaf area index ( $m^2 m^{-2}$ )
!
! 0.2 Output variables
REAL(r_std), DIMENSION (kjpindex,nvm), INTENT(out) :: veget_max    !! Maximum fraction of vegetation type including none biological fraction (unitless)
REAL(r_std), DIMENSION (kjpindex,nvm), INTENT(out) :: veget        !! Fraction of vegetation type including none biological fraction (unitless)
REAL(r_std), DIMENSION (kjpindex,nobio), INTENT(out) :: frac_nobio   !! Fraction of ice, lakes, cities etc. in the mesh
REAL(r_std), DIMENSION (kjpindex), INTENT(out)       :: totfrac_nobio !! Total fraction of ice+lakes+cities etc. in the mesh
REAL(r_std), DIMENSION (kjpindex), INTENT(out)       :: tot_bare_soil !! Total evaporating bare soil fraction
REAL(r_std), DIMENSION (kjpindex,nstm), INTENT(out) :: soiltile     !! Fraction of each soil tile (0-1, unitless)
!
! 0.3 Local variables
INTEGER(i_std)                      :: ji, jv        !! Loop index

!! Update vegetation fractions with the values coming from the vegetation file read in slowproc_readvegetmax.
!! Partial update has been taken into account for the case with DGVM and AGRICULTURE in slowproc_readvegetmax.
veget_max = veget_max_new
frac_nobio = frac_nobio_new

!! Verification and correction on veget_max, calculation of veget and soiltile.
CALL slowproc_veget (kjpindex, lai, frac_nobio, totfrac_nobio, veget_max, veget, soiltile)

!! Calculate tot_bare_soil needed in hydrol, diffuco and condveg
tot_bare_soil(:) = veget_max(:,1)
DO jv = 2, nvm
  DO ji = 1, kjpindex
    tot_bare_soil(ji) = tot_bare_soil(ji) + (veget_max(ji,jv) - veget(ji,jv))
  ENDDO
END DO
>>>>> .merge-right.r3190

END MODULE slowproc

```

## 6. Accepting trunk version:

```
$ svn revert src_sechiba/slowproc.f90
Reverted 'src_sechiba/slowproc.f90'
```

## 7. Actual status:

```
$ svn st ?      .config M      src_parallel/xios_orchidee.f90
M      src_parallel/ioipsl_para.f90
M      orchidee.default

Transmitting file data .....
Committed revision 3191.
```

9. After some attempts, code is fixed manually, giving a final revision number # 3197

### D.1.2 compiling rebuild

## D.2 Running tests

### D.2.1 standard

1. From: [/data/lfita/etudes/DYNAMICO/ORCHIDEE/tests/ORCHIDEE\\_DL/dynor](/data/lfita/etudes/DYNAMICO/ORCHIDEE/tests/ORCHIDEE_DL/dynor) and following: <https://forge.ipsl.jussieu.fr/orchidee/wiki/Documentation/UserGuide/TestCase1>
2. Getting the files directly from ciclad

```
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/METEO/NCC/ncc_for_1982.nc
forcing_file.nc
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/PFTmap_1850to2005_AR5_LUHa.rc2/PFTmap_IPCC_1982.nc
./PFTmap.orig.nc
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/soils_param.nc
./soils_param.orig.nc
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/reftemp.nc ./
```

3. Using the new files with the descriptive variable (**NOTE: NOT needed!!!**):

```
$ ln -s new_PFTmap.nc ./PFTmap.nc
$ ln -s new_soils_param.nc ./soils_param.nc
```

4. Getting the XIOS files:

```
$ cp /data/lfita/DATA/modipsl/modeles/ORCHIDEE/src_xml/iodef_xios1.xml
./iodef.xml $ cp /data/lfita/DATA/modipsl/modeles/ORCHIDEE/src_xml/context_orchidee.xml
./
$ cp /data/lfita/DATA/modipsl/modeles/ORCHIDEE/src_xml/field_def_orchidee.xml
./
$ cp /data/lfita/DATA/modipsl/modeles/ORCHIDEE/src_xml/file_def_orchidee.xml
.
```

5. Keeping an original copy of the file, an modifying it accordingly (also buffer increase):

```
$ cp file_def_orchidee.xml file_def_orchidee.orig.xml
$ vim file_def_orchidee.xml
```

6. Getting ‘run.def’ and edditing it accordongly:

```
$ cp /data/lfita/DATA/modips1/config/ORCHIDEE_OL/FORCESOIL/PARAM/run.def
./
$ vim run.def
```

## 7. Running it:

- Running it manually

### (a) Loading environment

```
$ module load openmpi/1.4.5-ifort
$ module load netcdf4/4.2.1.1-ifort
$ ulimit -s unlimited
```

### (b) Running it

```
$ ./orchidee_ol > out_orchidee_ol 2>&1
```

### (c) Remember to remove restart files if has been any error:

```
$ rm *rest*
```

### (d) Rebuilding after run

```
$ module load netcdf4/4.2.1.1-ifort
$ module load openmpi/1.4.5-ifort
/home/igcmg/rebuild/src_X64_CICLAD/modips1_v2_2_3_netcdf4.2/bin/rebuild
-o sechiba_out_2.nc sechiba_out_2_0*
/home/igcmg/rebuild/src_X64_CICLAD/modips1_v2_2_3_netcdf4.2/bin/rebuild
-o sechiba_history.nc sechiba_history_0*
/home/igcmg/rebuild/src_X64_CICLAD/modips1_v2_2_3_netcdf4.2/bin/rebuild
-o stomate_history.nc stomate_history_0*
/home/igcmg/rebuild/src_X64_CICLAD/modips1_v2_2_3_netcdf4.2/bin/rebuild
-o stomate_ipcc_history.nc stomate_ipcc_history_0*
```

- Running it in parallel

### (a) Getting the script

```
$ cp /home/lfita/etudes/OR4L/ciclad/run_orchidee_ol-intel_mpi-openmp.pbs
./
```

### (b) Running it

```
$ qsub run_orchidee_ol-intel_mpi-openmp.pbs
```

## D.2.2 Execution errors

- Buffer size error:

```
(...)
> Error [CCClientBuffer::hasSpace(int size)] : In file
'/data/lfita/DATA/modips1/modeles/XIOS/src/buffer_client.cpp', line 49 -> request
size is too big for buffer, increase buffer client size
Current buffer_size : 10000000
buffer_size must be > 36937124

Modify in 'iodef.xml' buffer_size:
<variable id="buffer_size" type="integer">36937124</variable>
```

## D.3 Running control runs

In order to compare results from modifications. A series of ‘control’ is needed. Thus, a new installation/compilation of ORCHIDEE is done. From /data/lfita/DATA/:

### D.3.1 standard

- Getting the code in a new folder modipsl\_preDYN

```
$ svn co http://forge.ipsl.jussieu.fr/igcmg/svn/modipsl/trunk
modipsl_preDYN
```

- Setting up new model related to the version just before the modifications started coupling DYNAMICO-ORCHIDEE (remember merging with trunk!):

```
$ cd modipsl/util
vim mod.def
```

```
#-H- ORCHIDEE_trunk ORCHIDEE-DYNAMICO configuration
#-H- ORCHIDEE_trunk This is a working configuration using the latest revision of ORCHIDEE trunk
#-M- ORCHIDEE_trunk Josefine.Ghattas@ipsl.jussieu.fr
#-C- ORCHIDEE_trunk IOIPSL/tags/v2_2_2/src HEAD 8 IOIPSL/src modeles
#-C- ORCHIDEE_trunk branches/ORCHIDEE-DYNAMICO/ORCHIDEE 3190 14 ORCHIDEE modeles
#-C- ORCHIDEE_trunk trunk/ORCHIDEE_OL HEAD 14 ORCHIDEE_OL config
#-C- ORCHIDEE_trunk XIOS/branchs/xios-1.0 604 12 XIOS modeles
```

- Getting the code<sup>9</sup>

```
$ ./model ORCHIDEE_trunk
```

- Compiling the code<sup>10</sup>:

```
$ ./ins_make >& run_ins_make.log
```

- Going there:

```
$ cd ../config/ORCHIDEE_OL
```

- Modifying some issues for compilation in CICLAD (in **Makefile**, adding no-parallel compilation):

```
(...) ./make_xios (...) --netcdf_lib netcdf4_seq (...)
```

- Compiling

```
$ gmake >& run_gmake.log
```

- Checking for errors (should be empty):

```
$ cat -n run_gmake.log | grep Error
$ cat -n run_gmake.log | grep Erreur
```

- Execution folder:

```
$ cd /data/lfita/etudes/DYNAMICO/ORCHIDEE/tests/ORCHIDEE_OL/control
```

- Getting the files from ciclad

<sup>9</sup>NOTE: use the right pwd for the subversion user!!

<sup>10</sup>following <http://forge.ipsl.jussieu.fr/igcmg/wiki/IPSLCM5A#Commentacc%c3%a9der%c3%a0IPSLCM5Acompileretlancerunepremi%c3%a8reexp%c3%a9rience>

```
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/METEO/NCC/ncc_for_1982.nc
forcing_file.nc
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/PFTmap_1850to2005_AR5_LUHa.rc2/PFTmap_IPCC_1982.nc
./PFTmap.nc
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/soils_param.nc ./
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/reftemp.nc ./
```

## 12. Getting the XIOS files:

```
$ cp /data/lfita/DATA/modips1/modeles/ORCHIDEE/src_xml/iodef_xios1.xml
./iodef.xml $ cp /data/lfita/DATA/modips1/modeles/ORCHIDEE/src_xml/context_orchidee.xml
./
$ cp /data/lfita/DATA/modips1/modeles/ORCHIDEE/src_xml/field_def_orchidee.xml
./
$ cp /data/lfita/DATA/modips1/modeles/ORCHIDEE/src_xml/file_def_orchidee.xml
.
```

## 13. Keeping an original copy of the file, an modifying it accordingly:

```
$ cp file_def_orchidee.xml file_def_orchidee.orig.xml
$ vim file_def_orchidee.xml
```

## 14. Getting ‘run.def’ and edditing it accordongly:

```
$ cp /data/lfita/DATA/modips1/config/ORCHIDEE_DL/FORCESOIL/PARAM/run.def
./
$ vim run.def
```

## 15. Getting the executable:

```
$ ln -s /data/lfita/DATA/modips1_preDYN/bin/orchidee_dl ./
```

## 16. Running it:

- Running it manually

- (a) Loading environment

```
$ module load openmpi/1.4.5-ifort
$ module load netcdf4/4.2.1.1-ifort
$ ulimit -s unlimited
```

- (b) Running it

```
$ ./orchidee_dl > out_orchidee_dl 2>&1
```

- (c) Remember to remove restart files if has been any error:

```
$ rm *rest*
```

- Running it in parallel

- (a) Getting the script

```
$ cp /home/lfita/etudes/OR4L/ciclad/run_orchidee_dl-intel_mpi-openmp.pbs
./
```

- (b) Running it

```
$ qsub run_orchidee_dl-intel_mpi-openmp.pbs
```

### D.3.2 using carteveget5km.nc

- First one should indicate in the `run.def` file the use of a new vegetation map.

```
VEGETATION_FILE = carteveg5km.nc
LAND_USE = n
IMPOSE_VEG = n
MAP_PFT_FORMAT = n
```

- Getting the required file

```
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/carteveg5km.nc ./
```

- running the simulation

```
$ qsub run_orchidee.ol-intel_mpi-openmp.pbs
```

### D.3.3 activating routing

- First one should indicate in the `run.def` file the use of routing.

```
RIVER_ROUTING = y
ROUTING_FILE = routing.nc
HYDROL_CWRR = y
DT_ROUTING = 86400
RIVER_DESC = y
RIVER_DESC_FILE = river_desc.nc
ROUTING_RIVERS = 50
```

- Getting the required files

```
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/routing.nc ./
cp /prodigfs/ipslfs/igcmg/IGCM/SRF/cartepente2d_15min.nc ./
```

- running the simulation

```
$ qsub run_orchidee.ol-intel_mpi-openmp.pbs
```

### D.3.4 using alb\_bg\_jrctip.nc

- First one should indicate in the `run.def` file the use the file.

```
ALB_BG_MODIS=y
```

- Getting the required file

```
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/albedo/alb_bg_jrctip.nc ./
```

- running the simulation

```
$ qsub run_orchidee.ol-intel_mpi-openmp.pbs
```

### D.3.5 using reftemp.nc

1. First one should indicate in the `run.def` file the use the file.

```
READ_REFTEMP=y
```

2. Getting the required file

```
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/reftemp.nc ./
```

3. running the simulation

```
$ qsub run_orchidee.ol-intel_mpi-openmp.pbs
```

### D.3.6 using orchidee\_fertilizer\_1995.nc

1. First one should indicate in the `run.def` file the use the file.

```
CHEMISTRY_BVOC = y
CO2_FOR_BVOC_WILKINSON=n
CO2_FOR_BVOC_POSSELL=n
```

2. Getting the required files

```
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/chemistry/orchidee_fertilizer_1995.nc .
./
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/chemistry/orchidee_bbg_clim.nc ./
```

3. running the simulation

```
$ qsub run_orchidee.ol-intel_mpi-openmp.pbs
```

### D.3.7 using ‘none’ as soils texture

1. First one should indicate in the `run.def` file the use of ‘none’ soil textures

```
HYDROL_CWRR = y
SOILTYPE_CLASSIF = none
SOILCLASS_FILE = soils_param.nc
SOILALB_FILE = soils_param.nc
```

2. Getting the required file

```
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRFsoils_param.nc ./
```

3. running the simulation

```
$ qsub run_orchidee.ol-intel_mpi-openmp.pbs
```

### D.3.8 using soils\_param\_usda.nc

- First one should indicate in the `run.def` file the use of the complementary textures map<sup>11</sup>.

```
HYDROL_CWRR = y
SOILTYPE_CLASSIF = usda
SOILCLASS_FILE = soils_param_usda.nc
SOILALB_FILE = soils_param.nc
```

- Getting the required file

```
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRFsoils_param_usda.nc ./
```

- running the simulation

```
$ qsub run_orchidee.ol-intel_mpi-openmp.pbs
```

### D.3.9 using alb\_bg.nc

- After merge with trunk r3711, there is a new albedo file with two variables ‘bg\_alb\_vis’, ‘bg\_alb\_nir’
- Getting the required file

```
$ cp /prodigfs/ipslfs/igcmg/IGCM/SRF/albedo/alb_bg_modisopt_2D.nc
alb_bg.nc ./
```

- running the simulation

```
$ qsub run_orchidee.ol-intel_mpi-openmp.pbs
```

### D.3.10 using lai2D.nc

- First one should indicate in the `run.def` file the use the file.

```
LAI_FILE = lai2D_03.nc
STOMATE_OK_CO2= y
STOMATE_OK_STOMATE= n
LAI_MAP = y
```

- Getting the required file

```
$ ln -s /prodigfs/ipslfs/igcmg/IGCM/SRF/lai2D_03.nc ./
```

- running the simulation

```
$ qsub run_orchidee.ol-intel_mpi-openmp.pbs
```

---

<sup>11</sup>Following documentation from A. Ducharme [http://forge.ipsl.jussieu.fr/orchidee/attachment/wiki/Documentation/UserGuide/eqs\\_hydrol.pdf](http://forge.ipsl.jussieu.fr/orchidee/attachment/wiki/Documentation/UserGuide/eqs_hydrol.pdf)

### D.3.11 using ORCHIDEE\_13PFTmap\_2010\_cmpi6\_LUH2v2h.nc

1. First one should indicate in the `run.def` file the use of a new PFT map at  $0.25^{\circ}$  of horizontal resolution.

```
VEGETATION_FILE = PFTmap_025.nc
```

2. Getting the required file

```
$ ln -s /data/jgipsl/ORCHIDEE_13PFTmap_2010_cmpi6_LUH2v2h.nc  
./PFTmap_025.nc
```

3. running the simulation

```
$ qsub run_orchidee.ol-intel_mpi-openmp.pbs
```

## E Trunk merging

Once modifications have been checked and shown that they work, one needs to merge with the trunk in order to have the modifications with the last version of the trunk. Doing that, modifications in the branch will be ready to be fully incorporated with trunk and make them available for every ORCHIDEE user.

```
$ svn merge -r [branch_trunk_rev]:[trunk_rev]
svn://forge.ipsl.jussieu.fr/orchidee/trunk/ORCHIDEE
```

1. Current version of the trunk

```
$ svn info svn://forge.ipsl.jussieu.fr/orchidee/trunk/ORCHIDEE
Path: ORCHIDEE
URL: svn://forge.ipsl.jussieu.fr/orchidee/trunk/ORCHIDEE
Repository Root: svn://forge.ipsl.jussieu.fr/orchidee
Repository UUID: f489ceea-5127-0410-b15c-c4a6149ed9a7
Revision: 3469
Node Kind: directory
Last Changed Author: anne.cozic
Last Changed Rev: 3462
Last Changed Date: 2016-05-25 10:31:04 +0200 (Wed, 25 May 2016)
```

2. Starting point. **NOTE: Make sure there is not any pending commit in the branch!!!**<sup>12</sup>

```
$ svn info
Path: .
URL: svn://forge.ipsl.jussieu.fr/orchidee/branches/ORCHIDEE-DYNAMICO/ORCHIDEE
Repository Root: svn://forge.ipsl.jussieu.fr/orchidee
Repository UUID: f489ceea-5127-0410-b15c-c4a6149ed9a7
Revision: 3214
Node Kind: directory
Schedule: normal
Last Changed Author: lluis.fita
Last Changed Rev: 3198
Last Changed Date: 2016-02-08 05:41:44 +0100 (Mon, 08 Feb 2016)
```

3. The merge will be done first in dry mode to check what will be changed (branch was merged with trunk revision 3190)

---

<sup>12</sup>\$ svn st, should only have ? as file status!

```
$ svn merge --dry-run -r 3190:3469 svn://forge.ipsl.jussieu.fr/orchidee/trunk/ORCHIDEE

M      arch/arch-ifort_LSCE.fcm

```

6. Once all the conflicts are solved, check for error messages along the compilation and solve the problems (from `/data/lfita/DATA/modips1/config/ORCHIDEE_OL`)

```
$ gmake clean
$ gmake >& run_gmake.log; cat -n run_gmake.log | grep Error
```

7. After all errors solved commit

```
$ svn commit
```

8. Perform running tests on running folder `/data/lfita/etudes/DYNAMICO/ORCHIDEE/tests/ORCHIDEE_OL/dynor`.

9. First copying new `xml` files:

```
$ cp /data/lfita/DATA/modips1/modeles/ORCHIDEE/src_xml/context_orchidee.xml .
$ cp /data/lfita/DATA/modips1/modeles/ORCHIDEE/src_xml/field_def_orchidee.xml .
$ cp /data/lfita/DATA/modips1/modeles/ORCHIDEE/src_xml/file_def_orchidee.xml .
$
```

10. Configuring file `file_def_orchidee.xml` (it has the `_AUTO_` variable from the `libIGCM`)

```
$ vim file_def_orchidee.xml
<file id="sechiba1" name="sechiba_history" output_freq="1mo"
enabled=".TRUE.">
<file id="stomate1" name="stomate_history" output_level="10"
output_freq="1d" enabled=".TRUE.">
<file id="stomate2" name="stomate_ipcc_history" output_level="1"
output_freq="1mo" enabled=".TRUE.">
```

## E.1 Getting trunk version r3469 to realize checking tests

Once the merge has been carried out, checks of non-modified results should be done. From `/data/lfita/DATA`

1. Getting the `libIGCM` code

```
$ svn co http://forge.ipsl.jussieu.fr/igcmg/svn/modips1/trunk
modips1_r3469
```

2. Getting the right version of the sources

```
$ cd modips1_r3469/util
$ vim mod.def
#---- Offline configurations with ORCHIDEE

#H- ORCHIDEE_trunk ORCHIDEE offline configuration
#H- ORCHIDEE_trunk This is a working configuration using the latest
revision of ORCHIDEE trunk
#M- ORCHIDEE_trunk Josefine.Ghattas@ipsl.jussieu.fr
#C- ORCHIDEE_trunk IOIPSL/tags/v2_2_2/src HEAD 8 IOIPSL/src modeles
#C- ORCHIDEE_trunk tags/libIGCM_v2.7 HEAD 10 libIGCM .
#C- ORCHIDEE_trunk trunk/ORCHIDEE 3469 14 ORCHIDEE modeles
#C- ORCHIDEE_trunk trunk/ORCHIDEE_OL HEAD 14 ORCHIDEE_OL config
#C- ORCHIDEE_trunk XIOS/branches/xios-1.0 604 12 XIOS modeles
```

3. Getting the code

```
$ ./model ORCHIDEE_trunk
```

4. compiling the code:

```
$ ./ins_make >& run_ins_make.log
```

5. Going there:

```
$ cd ../config/ORCHIDEE_OL
```

6. Modifying some issues for compilation in CICLAD (in Makefile, adding no-parallel compilation):

```
(...)
./make_xios (...) --netcdf_lib netcdf4_seq (...)
```

7. Compiling

```
$ gmake >& run_gmake.log
```

8. Checking for errors (should be empty):

```
$ cat -n run_gmake.log | grep Error
$ cat -n run_gmake.log | grep Erreur
```

## E.2 Checking tests

Checking tests are necessary to be sure that any errors have been made during the merging. This checks are done in the folder /data/lfita/etudes/DYNAMICO/ORCHIDEE/tests/ORCHIDEE\_OL/merge\_tests. Script `perform_ortests.bash` run 1982 91-days global off-line runs with all the possible off-line ORCHIDEE configurations: `simple`, `olson`, `routing`, `modisalb`, `reftemp`, `pftipcc`, `chem` (see table 10 with explanation of the anachronisms)

At each new version, there are new variables in the ORCHIDEE output, thus, `.xml` files have to be update too

1. Getting the right version of `xml` files (that files from `src_xml` with a modification [M] when merging with the trunk):

```
$ cp /data/lfita/DATA/modipsl_r3469/modeles/ORCHIDEE/src_xml/context_orchidee.xml
$ cp /data/lfita/DATA/modipsl_r3469/modeles/ORCHIDEE/src_xml/file_def_orchidee.xml
$ cp /data/lfita/DATA/modipsl_r3469/modeles/ORCHIDEE/src_xml/field_def_orchidee.xml
```

2. While we are using `libIGCM`, `xml` files have some `_AUTO_` values which have to be modified:

```
<file id="sechiba1" name="sechiba_history" output_level="11"
output_freq="1mo" enabled=".TRUE.">
<file id="sechiba2" name="sechiba_out_2" output_level="2"
output_freq="10800s" enabled=".TRUE.">
<file id="stomate1" name="stomate_history" output_level="10"
output_freq="1d" enabled=".TRUE.">
<file id="stomate2" name="stomate_ipcc_history" output_level="1"
output_freq="1mo" enabled=".TRUE.">
```

Table 10: Table of checks between different ORCHIDEE compiled versions. All simulations use: forcing\_file.nc (link from ncc\_for\_1982.nc), PFTmap.nc (link from PFTmap\_1850to2005\_AR5\_LUHa.rc2/PFTmap\_IPCC\_1982.nc), soils\_param.nc

<b>name</b>	<b>Additional files to use</b>	<b>description</b>
simple		simplest ORCHIDEE configuration
olson	carteveg5km.nc	using Olson 5km vegetation configuration
routing	routing.nc, cartepente2d_15min.nc	simulation with routing activated
modisalb	alb_bg_jrctip.nc	using albedo from MODIS satellite measurements
reftemp	reftemp.nc	using reference temperature
pftipcc	PFTmap_IPCC_2000.nc	using pft from IPCC exercises
chem	orchidee_fertilizer_1995.nc, orchidee_bbg_clim.nc	activating chemical options
usda	soils_param_usda.nc	use of the complementary textures map <sup>a</sup>
usda	soils_param_usda.nc	without using of the complementary textures map
new albedo	alb_bg_modisopt_2D.nc	New albedo file since merge with trunk r3711
lai	lai2D_03.nc	use ‘LAI map’ instead of dynamical one from stomate

<sup>a</sup>Following documentation from A. Ducharme [http://forge.ipsl.jussieu.fr/orchidee/attachment/wiki/Documentation/UserGuide/eqs\\_hydrol.pdf](http://forge.ipsl.jussieu.fr/orchidee/attachment/wiki/Documentation/UserGuide/eqs_hydrol.pdf)

### E.2.1 Second merge

A second merge was done on June 8th 2016:

1. Getting the current version of trunk

```
$ svn info svn://forge.ipsl.jussieu.fr/orchidee/trunk/ORCHIDEE
Path: ORCHIDEE
URL: svn://forge.ipsl.jussieu.fr/orchidee/trunk/ORCHIDEE

```

#### 4. Solving conflicts

- Conflict in `src_xml/field_def_orchidee.xml`

```

<<<<<.working
  <field id="asoilcol" name="asoilcol" long_name="Availability of data
for the soil color interpolation (negative values if no data found)"
unit="1" operation="once"/>
  <field id="evap" name="evap" long_name="Evaporation" unit="mm/d"/>
  <field id="coastalflow" name="coastalflow" long_name="Diffuse coastal
flow" unit="m^3/s"/>
  <field id="riverflow" name="riverflow" long_name="River flow to the
oceans" unit="m^3/s"/>
=====
  <field id="vevapp" name="evap_sec" long_name="Total Evaporation"
unit="kg/m^2/s"/>
  <field id="vevapp_day" name="evap" field_ref="vevapp"
long_name="Evaporation per day" unit="mm/d" > vevapp*86400 </field>
>>>>> .merge-right.r3711

```

- Solved as:

```

  <field id="asoilcol" name="asoilcol" long_name="Availability of data
for the soil color interpolation (negative values if no data found)"
unit="1" operation="once"/>
  <field id="coastalflow" name="coastalflow" long_name="Diffuse coastal
flow" unit="m^3/s"/>
  <field id="riverflow" name="riverflow" long_name="River flow to the
oceans" unit="m^3/s"/>
  <field id="vevapp" name="evap_sec" long_name="Total Evaporation"
unit="kg/m^2/s"/>
  <field id="vevapp_day" name="evap" field_ref="vevapp"
long_name="Evaporation per day" unit="mm/d" > vevapp*86400 </field>

```

- Solved:

```

$ svn resolve -accept working src_xml/field_def_orchidee.xml
Resolved conflicted state of 'src_xml/field_def_orchidee.xml'
$ svn st src_xml/field_def_orchidee.xml
M    src_xml/field_def_orchidee.xml

```

- Conflict in `src_xml/file_def_orchidee.xml`

```
<<<<< .working
  <field field_ref="asoilcol" level="11"/>
=====
  <field field_ref="frac_snow" level="11"/>
  <field field_ref="lake_overflow_coast" level="7"/>
  <field field_ref="frac_snow_veg" level="12"/>
  <field field_ref="frac_snow_nobio" level="12"/>
>>>>> .merge-right.r3711
```

- Solved as:

```
<field field_ref="asoilcol" level="11"/>
<field field_ref="frac_snow" level="11"/>
<field field_ref="lake_overflow_coast" level="7"/>
<field field_ref="frac_snow_veg" level="12"/>
<field field_ref="frac_snow_nobio" level="12"/>
```

- solved

```
$ svn resolve -accept working src_xml/file_def_orchidee.xml
Resolved conflicted state of 'src_xml/file_def_orchidee.xml'
$ svn st src_xml/file_def_orchidee.xml
M    src_xml/file_def_orchidee.xml
```

- All conflicts in `src_sechiba/condveg.f90` are related to the use of a new file `alb_bg.nc` (as a copy of the real file `alb_bg_modisopt_2D.nc`) instead of `alb_bg_jrctip.nc` in ‘`condveg_background_soilalb`’. In this new file and methodology, there are two variables `bg_alb_vis`, `bg_alb_nir`, without temporal dependency. Changes are too long to be detailed here.

```
$ svn resolve -accept working src_sechiba/condveg.f90
Resolved conflicted state of 'src_sechiba/condveg.f90'
```

5. Merge is done and committed: r3764

6. More changes in code are introduced after a meeting with Josefine Ghatas and Jan Polcher. Almost all of them committed with version r3767

- (a) Remove all the IF (ALLOCATED(X)) DEALLOCATE(X)
- (b) Check consistency of text in the preface of the subroutines
- (c) check text consistency on the `vecpos` section
- (d) No need to read again the variable inside `modifying_input[N]D`
- (e) Use `undef_sechiba` for that values not used for: `maskvals`
- (f) Remove all the `maskvar` from `masking_input`
- (g) No neeed to use `rangeR`, it can be done as `(/ (ip*1.,ip=1,Ntypes) /)`

7. More changes in code are introduced after a meeting with Josefine Ghatas and Jan Polcher (con't and finising).

- (a) remove sending up of the ‘Availability’ variables
- (b) Use of the full functions/subroutines’ name in error and debug messages instead of `TRIM(fname)` (`printlev`, `printlev_loc`, `ipslerr_p`)

8. After all these changes are committed:

```
$ svn commit
Sending     src_global/interpweight.f90
Sending     src_sechiba/chemistry.f90
Sending     src_sechiba/condveg.f90
Sending     src_sechiba/slowproc.f90
Sending     src_sechiba/thermosoil.f90
Sending     src_sechiba/thermosoilc.f90
Transmitting file data .....
Committed revision 3769.
```

9. Josefine Ghattas work on the code to make tests on the compilation and use with coupled runs with LMDZ.
10. After a meeting on October 2016 13th, was agreed to introduce a little bit more of commentaries on the header of the module `interpweight.F90`. Comments added which gives a final version at revision 3816.
11. Modifications have been added the trunk with the reference:

```
$ svn info
Path: .
URL: svn://forge.ipsl.jussieu.fr/orchidee/branches/ORCHIDEE-DYNAMICO/ORCHIDEE
Repository Root: svn://forge.ipsl.jussieu.fr/orchidee
Repository UUID: f489ceea-5127-0410-b15c-c4a6149ed9a7
Revision: 3839
Node Kind: directory
Schedule: normal
Last Changed Author: josefine.ghattas
Last Changed Rev: 3830
Last Changed Date: 2016-10-19 18:42:41 +0200 (Wed, 19 Oct 2016) |
```

12. On 2016 October 21st is found that tests over `lai2D.nc` file were not done and it is not working. Modifications are done in order to work with the `lai2D.nc` file
13. Work is finished on October 31st and code is also working with the `lai2D.nc` file

```
$ svn commit
Sending     src_global/interpweight.f90
Sending     src_sechiba/slowproc.f90
Transmitting file data ..
Committed revision 3853.
```

14. A new file is added into the ORCHIDEE flow: `ORCHIDEE_13PFTmap_2010_cmpi6_LUH2v2h.nc`  $0.25^\circ$  resolution map of PFTs. This file has a different way to create its mask. It has already been sea masked by giving the '`_fillValue`' to all the sea points. Thus, this file has to be used in a different way than the original `PFTmap.nc`. Assuming that this new file is used with a new name `PFTmap_0.25.nc` small modifications are introduced into:

- `src_sechiba/slowproc.f90` at subroutine '`slowproc_readvegetmax`':

```
IF (TRIM(filename) .EQ. 'PFTmap_025.nc') THEN
    ! Type of mask to apply to the input data (see header for more details)
    maskingtype = 'mbelow'
    ! Values to use for the masking
    maskvals = (/ 20., undef_sechiba, undef_sechiba /)
ELSE
    ! Type of mask to apply to the input data (see header for more details)
    maskingtype = 'msumrange'
    ! Values to use for the masking
    maskvals = (/ 1.-1.e-7, min_sechiba, 2. /)
END IF
```

- There was an issue on `src_global/interpweight.f90`. According to IOIPSL one needs to advice when a  $\leq 3D$  variable is read without a temporal axis. Looking in `IOIPSL/src/flincom.f90` at line #1296:

```

!- itau_dep : Time step at which we will start to read
!- itau_fin : Time step until which we are going to read
!-           For the moment this is done on indexes
!-           but it should be in the physical space.
!-           If there is no time-axis in the file then use a
!-           itau_fin < itau_dep, this will tell flinget not to
!-           expect a time-axis in the file.

```

Following it a huge assumption is made: all 3D fields will not have a time-axis. Thus in `src_global/interpweight.f90` at line #1076:

```

IF (is_root_prc) CALL flinget(fid, TRIM(varname), iml, jml, lml,
0, 2, 1, invar3D)

```

## F ORCHIDEE bug

A bug has been found in the code. When the trunk version of the code is compiled in debug mode (in the `Makefile`, change from `-prod` to `-debug`), model in `routing` configuration, simulation crashes.

- chem

Trying to compile with `gfortran` to check the possible origin of the bug. From `/data/lfita/DATA/MODIPSL/dynor`

## 1. Getting the code

```
$ svn co http://forge.ipsl.jussieu.fr/igcmg/svn/modipsl/trunk gfortran
```

## 2. Going to the configuration of the compilation

```
$ cd gfortran/uitl
```

3. Adding DYNAMIC\_OCHIDEE configuration in mod.def (see previous compilations as in appendix D)

```
$ vim mod.def
```

#### 4. Installing the sources:

```
$ ./model ORCHIDEE_DYNAMICO
```

5. In file `AA_make.gdef`, there is a gfortran compilation for CICLAD with the tag: `gfortran_CICLAD`. Thus changing to this configuration in file `w_i_h`:

```
$ vim w_i_h  
  ( ciclad* )           DSYS="gfortran_CICLAD";;
```

## 6. Including gfortran compilation for the XIOS

(a) Going to the **XIOS** source code:

```
$ cd ../../modeles/XIOS
```

(b) links `arch.fcm` and `arch.path` are empty (configuration files do not exist)

```
$ ls -la arch.fcm arch.path  
arch.path -> /data/lfita/DA  
arch.fcm -> /data/lfita/DAT
```

(c) Creating the `arch` files for XIOS to be compiled in CICLAD with `gfortran`

- arch/arch-gfortran\_CICLAD.fcm

```
#####
##### Projet XIOS #####
#####

%CCOMPILER      mpicc
%FCOMPILER      mpif90
%LINKER         mpif90

%BASE_CFLAGS    -ansi -w
%PROD_CFLAGS    -O3 -DBOOST_DISABLE_ASSERTS
%DEV_CFLAGS     -g -O2
%DEBUG_CFLAGS   -g

%BASE_FFLAGS    -D__NONE__
%PROD_FFLAGS    -O3
%DEV_FFLAGS     -g -O2
%DEBUG_FFLAGS   -g

%BASE_INC       -D__NONE__
%BASE_LD        -lstdc++

%CPP            cpp
%FPP            cpp -P
%MAKE           gmake
```

- arch/arch-gfortran\_CICLAD.path

```
NETCDF_INCDIR="-I/opt/netcdf42/gfortran/include"
NETCDF_LIBDIR="-L/opt/netcdf42/gfortran/lib"
NETCDF_LIB="-lnetcdf -lnetcdff"

MPI_INCDIR=""
MPI_LIBDIR=""
MPI_LIB=""

HDF5_INCDIR="-I/opt/hdf518/gfortran/include"
HDF5_LIBDIR="-L/opt/hdf518/gfortran/lib"
HDF5_LIB="-lhdf5_hl -lhdf5 -lhdf5_lz"

#OASIS_INCDIR="-I$PWD/../../oasis3-mct/BLD/build/lib/psmile.MPI1"
#OASIS_LIBDIR="-L$PWD/../../oasis3-mct/BLD/lib"
#OASIS_LIB="-lpsmile.MPI1 -lscript -lmct -lmpieu"
```

## 7. Including gfortran compilation for ORCHIDEE

- (a) Going to the ORCHIDEE source code:

```
$ cd ../../modeles/ORCHIDEE
```

- arch/arch-gfortran\\_CICLAD.fcm

```
%COMPILER      /usr/lib64/openmpi/1.6.5-gfortran/bin/mpif90
%LINK         /usr/lib64/openmpi/1.6.5-gfortran/bin/mpif90
%AR          ar
%MAKE         make
%FPP_FLAGS    -P -C -traditional
%FPP_DEF      NC_DOUBLE
%BASE_FFLAGS   -c -fdefault-real-8 -fcray-pointer
%PROD_FFLAGS   -O3 -funroll-all-loops
%DEV_FFLAGS    -O -Wall -fbounds-check
%DEBUG_FFLAGS   -ffpe-trap=invalid,zero,overflow -Wall
-fbounds-check -g3 -O0 -fstack-protector-all
%MPI_FFLAGS
%OMP_FFLAGS    -fopenmp
%BASE_LD       -Wl,-rpath=/opt/netcdf42/gfortran/lib
%MPI_LD
%OMP_LD        -fopenmp
```

- arch/arch-gfortran\\_CICLAD.path

```
NETCDF_LIBDIR="/opt/netcdf42/gfortran/lib -lnetcdf -lnetcdff"
NETCDF_INCDIR=/opt/netcdf42/gfortran/include
IOIPSL_INCDIR=/data/lfita/DATA/LMDZ/gfortran/modipsl/lib
IOIPSL_LIBDIR=/data/lfita/DATA/LMDZ/gfortran/modipsl/lib
```

8. installing the code (from util):

```
$ ./ins_make

Installation of makefiles, scripts and data for gfortran_CICLAD

Installation in ../config/ORCHIDEE_OL
Path from Makefile to modipsl/util : ../../util
Installation in ../modeles/ORCHIDEE/src_sechiba
Path from Makefile to modipsl/util : ../../..../util
Installation in ../modeles/ORCHIDEE/src_parameters
Path from Makefile to modipsl/util : ../../..../util
Installation in ../modeles/ORCHIDEE/src_parallel
Path from Makefile to modipsl/util : ../../..../util
Installation in ../modeles/ORCHIDEE/src_driver
Path from Makefile to modipsl/util : ../../..../util
Installation in ../modeles/ORCHIDEE/src_stomate
Path from Makefile to modipsl/util : ../../..../util
Installation in ../modeles/ORCHIDEE/src_global
Path from Makefile to modipsl/util : ../../..../util
Installation in ../modeles/ORCHIDEE
Path from Makefile to modipsl/util : ../../util
Installation in ../modeles/IOIPSL/src
Path from Makefile to modipsl/util : ../../..../util
```

9. Going there:

```
$ cd ../config/ORCHIDEE_OL
```

10. Modifying some issues for compilation in CICLAD (in **Makefile**, adding no-parallel compilation):

```
(...) ./make_xios --netcdf_lib netcdf4_seq (...)
```

11. Removing IOIPSL compilation in CICLAD (in **Makefile**):

```
# with_xios : Compiling ORCHIDEE, XIOS and IOIPSL.  
with_xios : xios driver_xios verif
```

12. Compiling

```
$ gmake >& run_gmake.log
```

13. Checking for errors (should be empty):

```
$ cat -n run_gmake.log | grep Error  
$ cat -n run_gmake.log | grep Erreur
```

## G Adding an output variable in XIOS

Different new variables with the information of the availability of the data used in the interpolation (`a[varname]`) have been added with `interpweight`. Here is described the process followed to add a variable as example.

1. In `sechiba_src/condveg.f90`, availability data information `asoilcol` for the soil color has been added. Declaration of the variable is done in the `field_def_orchidee.xml`. As soil color is used in `sechiba`, variable is defined in this section. This variable should only be output once (it does not change in time). Definition is added just after `albedo_glob` as:

```
<field id="asoilcol" name="asoilcol" long_name="Availability of data
for the soil color interpolation (negative values if no data found)"
unit="1" operation="once"/>
```

2. Variable has to be add into the input file. This is done in `file_def_orchidee.xml`. This diagnostic variable should only be output for specific cases, thus it will be attributed to a high level of output (11). Again, because it is a variable related to `sechiba`, it will be attributed to the file `sechiba_history.nc`. As the last variable with output level 11 (just after variable `snowgrain`) as:

```
<field field_ref="asoilcol" level="11"/>
```

3. Finally this variable should be output from the code. Within `src_sechiba/condveg.f90`, at the end of the subroutine `condveg_soilalb`:

```
! Write diagnostics
CALL xios_orchidee_send_field("asoilcol", asoilcol)
```

The same method is used to include the set of diagnostics of the '*data availability*', see variable-file attribution in table 11 the values for the vegetation map `aveget` are shown in figure 2

Table 11: File assignation of all the '*data availability*' diagnostic variables (unitless)

<b>variable</b>	<b>module#subroutine</b>	<b>output file</b>	<b>description</b>
achem_wrice	chemistry.f90#chemistry_initialize	sechiba_history.nc	Availability of data for the rice fertilizers interpolation (negative values if no data found)
achem_other	chemistry.f90#chemistry_initialize	sechiba_history.nc	Availability of data for the other crops fertilizers interpolation (negative values if no data found)
achem_co2	chemistry.f90#chemistry_initialize	sechiba_history.nc	Availability of data for the co2 bbg interpolation (negative values if no data found)
asoilcol	condveg.f90#condveg_soilalb	sechiba_history.nc	Availability of data for the soil color interpolation (negative values if no data found)
aalb_bg	condveg.f90#condveg_background_soilalb	sechiba_history.nc	Availability of data for the albedo interpolation from MODIS related data-set (negative values if no data found)
alaimap	slowproc.f90#slowproc_interlai	sechiba_history.nc	Availability of data for the lai interpolation (negative values if no data found)
aveget	slowproc.f90#slowproc_readvegetmax	sechiba_history.nc	Availability of data for the vegetation fraction interpolation (negative values if no data found)
aveget5k	slowproc.f90#slowproc_interp	sechiba_history.nc	Availability of data for the vegetation fraction at 5km interpolation (negative values if no data found)
atext	slowproc.f90#slowproc_soilt	sechiba_history.nc	Availability of data for the soil texture interpolation (negative values if no data found)
aslope	slowproc.f90#slowproc_slope	sechiba_history.nc	Availability of data for the slope interpolation (negative values if no data found)
areftemp	thermosoil.f90#read_reftempfile	sechiba_history.nc	Availability of data for the reftemp interpolation (negative values if no data found)
areftempc	thermosoilc.f90#read_reftempfile	sechiba_history.nc	Availability of data for the reftemp interpolation (negative values if no data found)

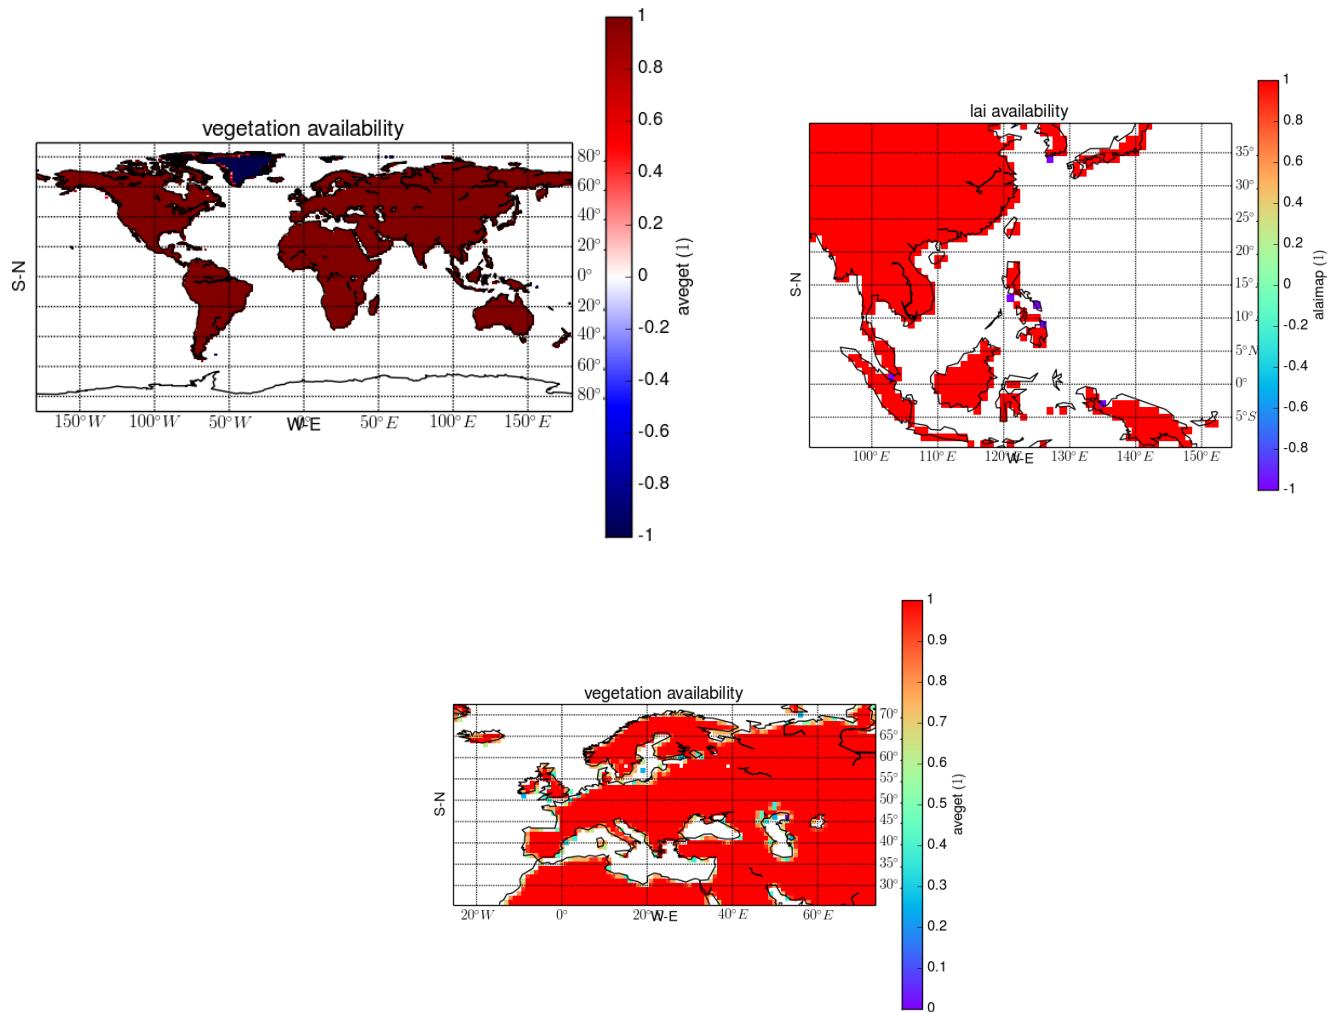

Figure 2: Availability data for the vegetation map `maxvegetfrac` found in `PFTmap.nc` (left) and LAI found in `lai2D_03.nc` and `maxvegetfrac` found in `ORCHIDEE_13PFTmap_2010_cmpi6_LUH2v2h.nc` (bottom)
